Pos.	Item no.	Description	Del. Quant
		Basis for the use of the ARGUS System (Hardware, Modules and Features) are the Terms of use belonging to the Quotation and/or Order confirmation Module: Dressing Monitoring Process monitoring of dressing and monitoring of grinding wheel breakages Process monitoring characterises the dressing process during and after the dressing and monitors it a 100%. Furthermore, grinding wheel breakages are detected during the dressing cycle whereby the definition of the limits and the working envelope are the responsibility of the user. ARGUS is an analysis-tool (workaid), the proposed adjustment are only a suggestion which are generated by the reference value of a "good workpiece". Applicable dressing technologies and tools: -Profile dressing -Ceramic bonded grinding wheels, fine and polish grinding wheels (Polishing is available from Software version V35.01 or higher) - double taper roll, profile roll and composite roll, multi-rib full profile roll Currently not available dressing technologies and tools: -Line dressing -Radius forming rolls and double radius forming rolls Process monitoring grinding Process monitoring of grinding characterizes the grinding process 100%, whereby the definition of the limits and the working envelope are the responsibility of the user. Applicable grinding technologies: -Grinding of involute gears with symmetrical and asymmetrical pressure angle - Conventional generating grinding - generating grinding with fine grinding - generating grinding with polishing grinding	

Pos.	Item no.	Description	Del. Quant
		-Grinding of beveloid gears -Sot grinding Currently not available grinding technologies And tools: -Process with Special Kinematics: Topological grinding with 2 flanking dressing Topo-type grinding Topological grinding with line dressing -Generating grinding of non-involute gears -Grinding with electroplated or dressable CBN tools -Discontinuous grinding processes (profile grinding) -Grinding and dressing technologies with very small modules (mn<0.5mm, need for internal clarification) ARGUS is an analysis-tool (workaid), the proposed adjustment are only a suggestion which are generated by the reference value of a "good workpiece". Crash retraction: Retraction and full stop of the machine when the set crash limits are exceeded. Standard exceeding of the limit only leads to the removal of individual workpieces without halting the production process Component monitoring is only activated in the hardware if the feature component monitoring is leased. This feature covers the following axes: X/ Y/ Z/ B/ C1/ C2 Component monitoring enables the automatic cyclical or manually monitoring of the axes involved in the grinding and dressing process. This feature makes it possible to evaluate the mechatronic state of the controlled axes. ARGUS is an analysis-tool (workaid), the proposed adjustment are only a suggestion which are generated by the reference value of a "good workpiece". Delivery time: after clarification of availability
